Health and Welfare

# The National Health Index consists of indicators describing regional differences in morbidity and work disability

- Indicators are published for wellbeing services counties, municipalities, and collaborative areas for healthcare and social welfare.
- The indicators are also published separately for men and women, describing regional differences in morbidity and work disability by sex. For example, the indices for men describe regional differences in morbidity and work disability among men.
- Several factors contribute to regional differences.
  - At the individual level, lifestyle factors play a central role. These include, for example, smoking, alcohol use, physical activity and dietary habits, but there are several other factors affecting lifestyles.
  - Unemployment, individuals' financial situation and educational background as well as cultural and genetic factors are reflected in the health and functional capacity of the population.
  - At the level of the service system, regional differences in the availability of health and social welfare services, and in seeking care may contribute to regional differences in morbidity and incapacity to work.
  - There are regional differences in disease treatment practices, in how patient-level medical information is documented, and in how comprehensive data in the Care Register for Healthcare is.
  - There may be deficiencies in the comprehensiveness of register data from Åland arising from people receiving treatment in Sweden. It is, however, likely that morbidity is lower there than elsewhere in the country. The results for Åland show exceptionally low index figures for almost all indicators. They have been excluded from this presentation.

# Main findings 2021–2023

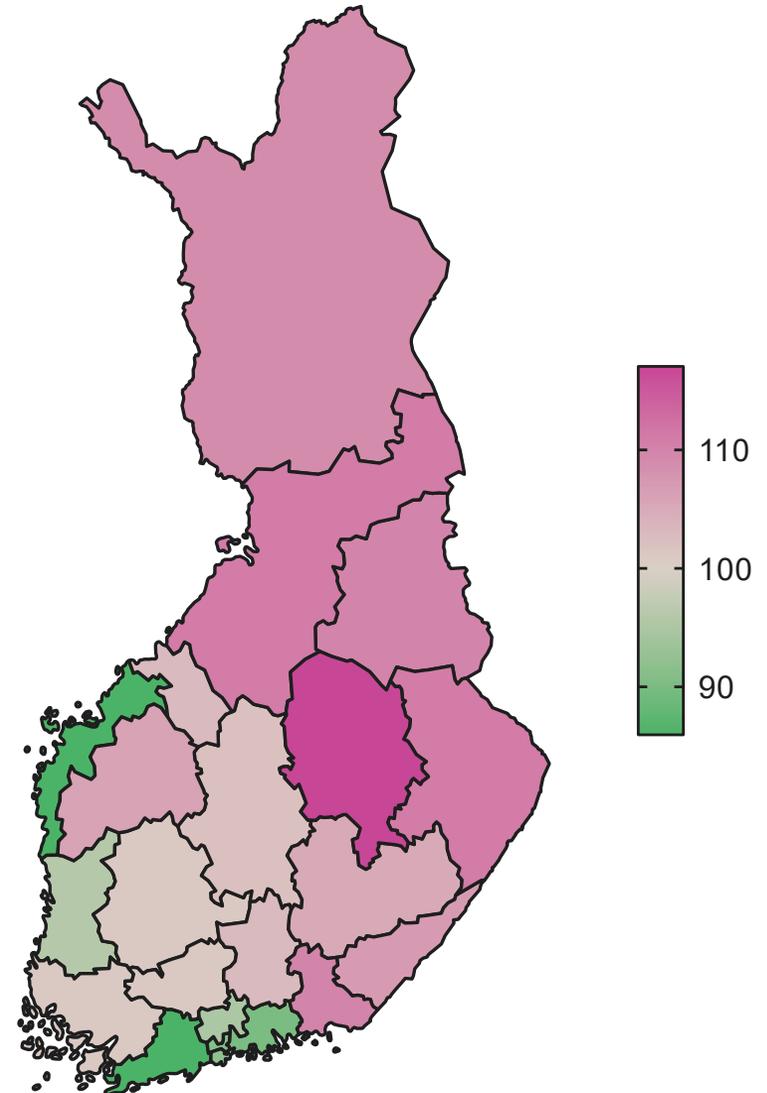

- **Morbidity** is highest in North Savo, lowest in West Uusimaa.
  - Among men and women, the morbidity index is highest in North Savo. Among men mortality is lowest in West Uusimaa, among women in Ostrobothnia.
- The largest regional differences are found in alcohol-related diseases, musculoskeletal disorders and mental health.
  - For these disease groups mortality is higher than in the whole country in the wellbeing services counties in Eastern and Northern Finland.
  - Alcohol related morbidity is also more prevalent than in the whole country in Päijät-Häme and Kymenlaakso.
- Regional differences in work disability are mainly in line with regional differences in morbidity.
- **Work disability** is the highest in Kainuu and North Savo and Kainuu, lowest in the Western Uusimaa.
  - Among men the work disability index is highest in Kainuu and among women in North Savo. Among both men and women work disability is lowest in West Uusimaa.
- Regional differences are higher for favourable decisions on vocational rehabilitation applications than for paid work disability pensions and sickness allowances.

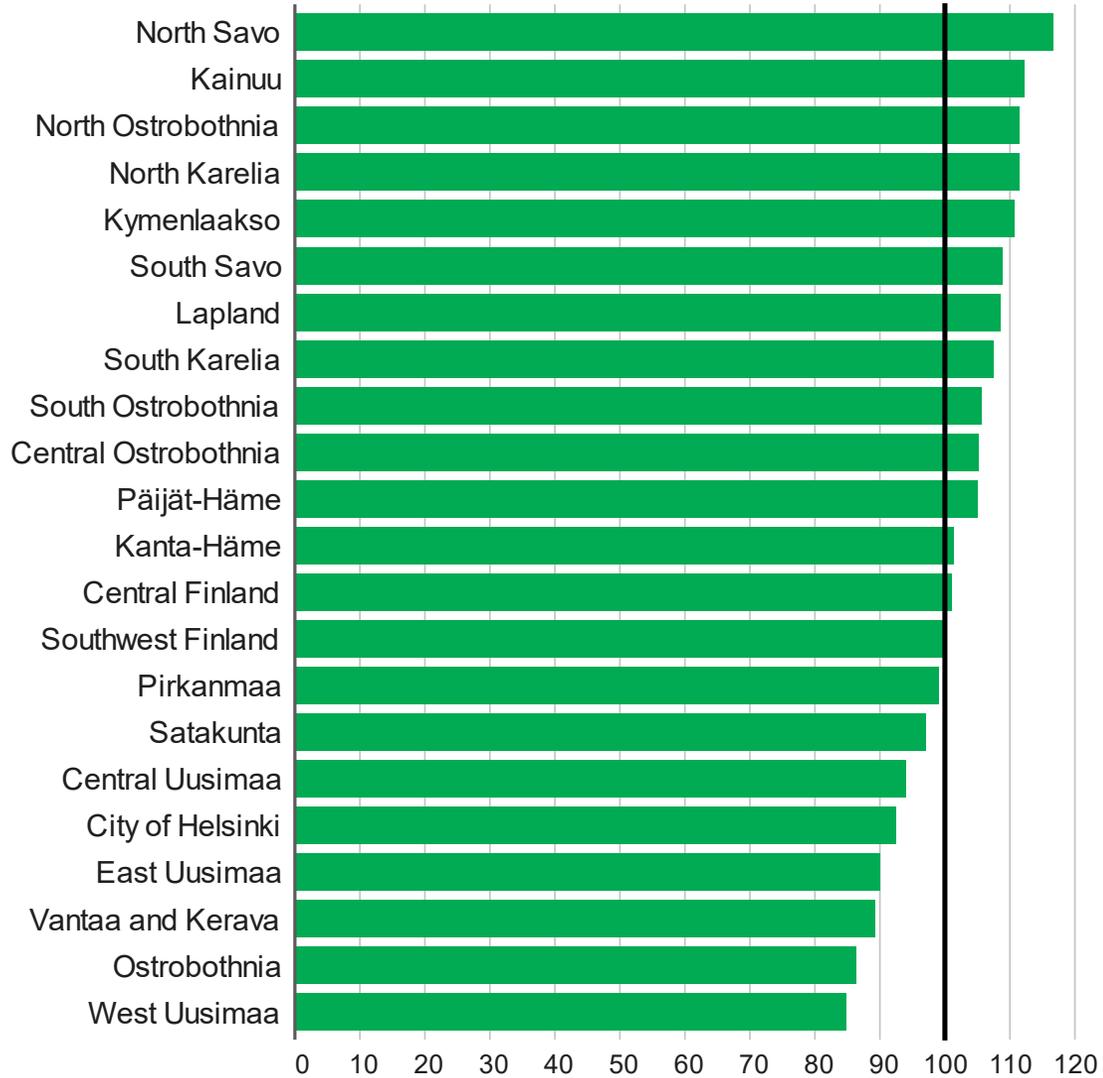

# Total index on morbidity

- The index measures morbidity of the region's population relative to the entire country. The index combines information of ten disease groups: cancers, coronary disease, cerebrovascular diseases, musculoskeletal disorders, severe mental health disorders, accidents, memory disorders, chronic respiratory diseases, diabetes and alcohol-related diseases.
- In the total morbidity index, the prevalence of each disease group is weighted according to its contribution to the Finnish population's overall mortality, work disability, quality of life and the costs of health and social services use.
- Morbidity is highest in North Savo and in other wellbeing services counties in Eastern and Northern Finland. Morbidity is lowest in West Uusimaa and in Ostrobothnia.

Age-standardised

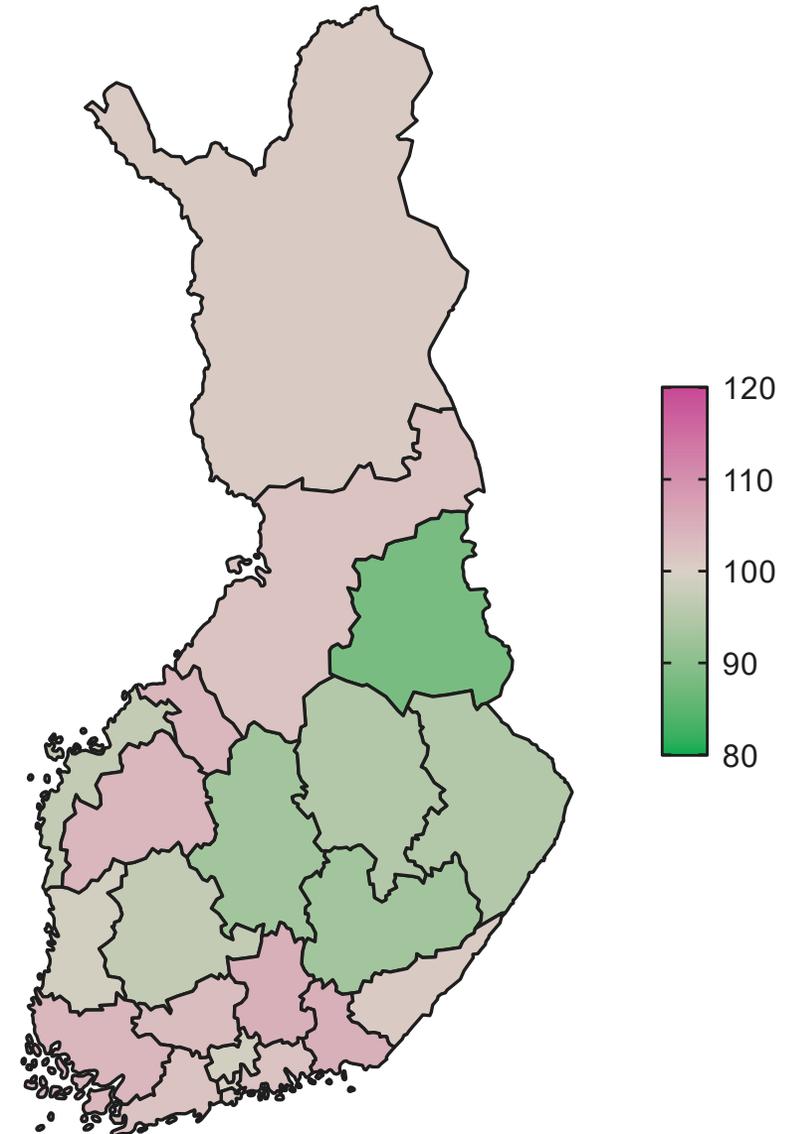

Morbidity index 2021–2023, women  
Age-standardised

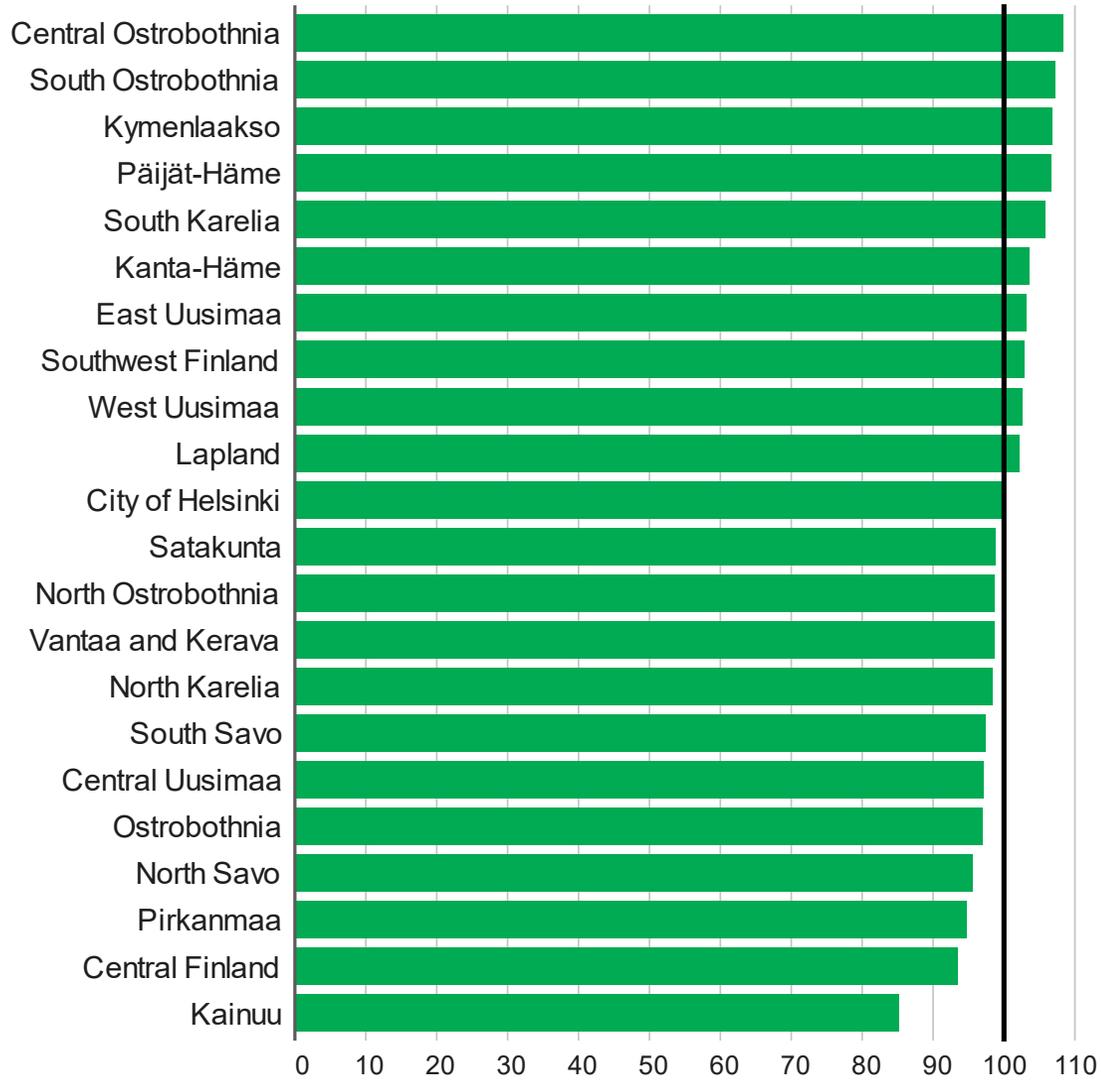

# Cancers

- The index describes the incidence of new cancer cases among the region's population relative to the national level.
- Index definition is based on data from the Cancer Registry. Skin cancers other than melanoma are excluded from the cancer types considered. The index does not consider the recurrence of cancers or the differences between the treatability of cancers and mortality related to different cancer types.
- Regional differences in the cancer index are smaller than in other disease groups.
- Cancer incidence is highest in Päijät-Häme and Kymenlaakso, lowest in the wellbeing services counties of Kainuu and Central Finland
- An index value higher than the national average may indicate high cancer incidence or that, at the same time, the region has been successful in the early diagnosis of cancer.

Age-standardised

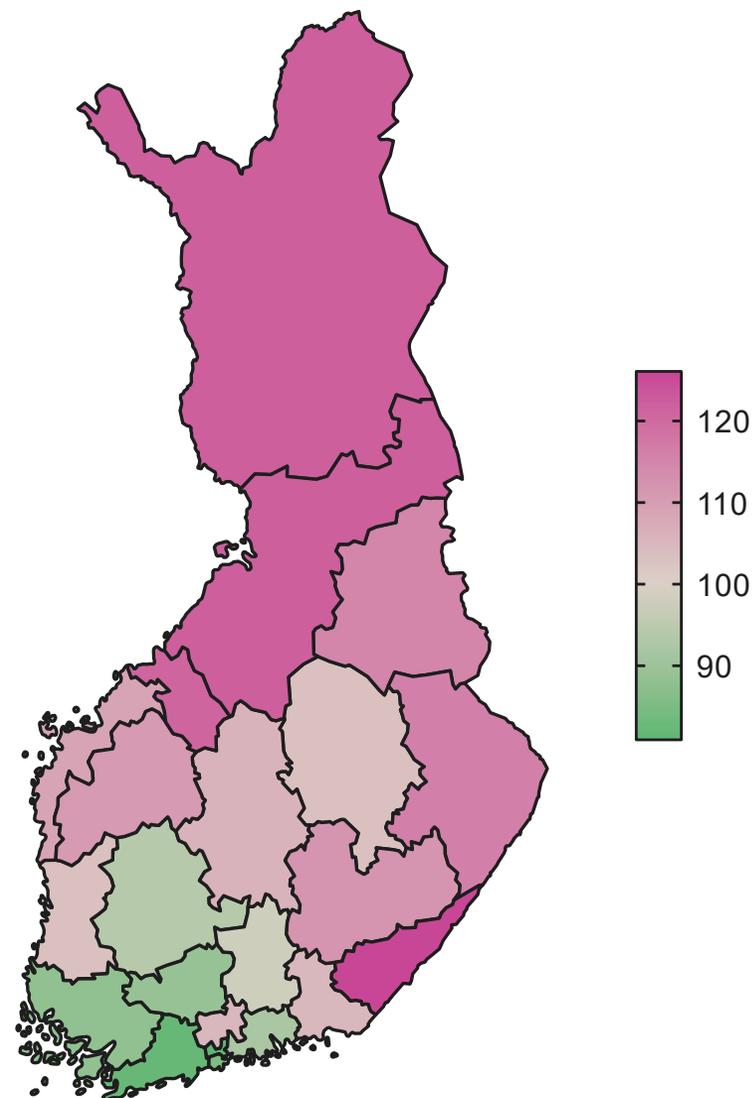

Cancer index 2021–2023, women  
Age-standardised

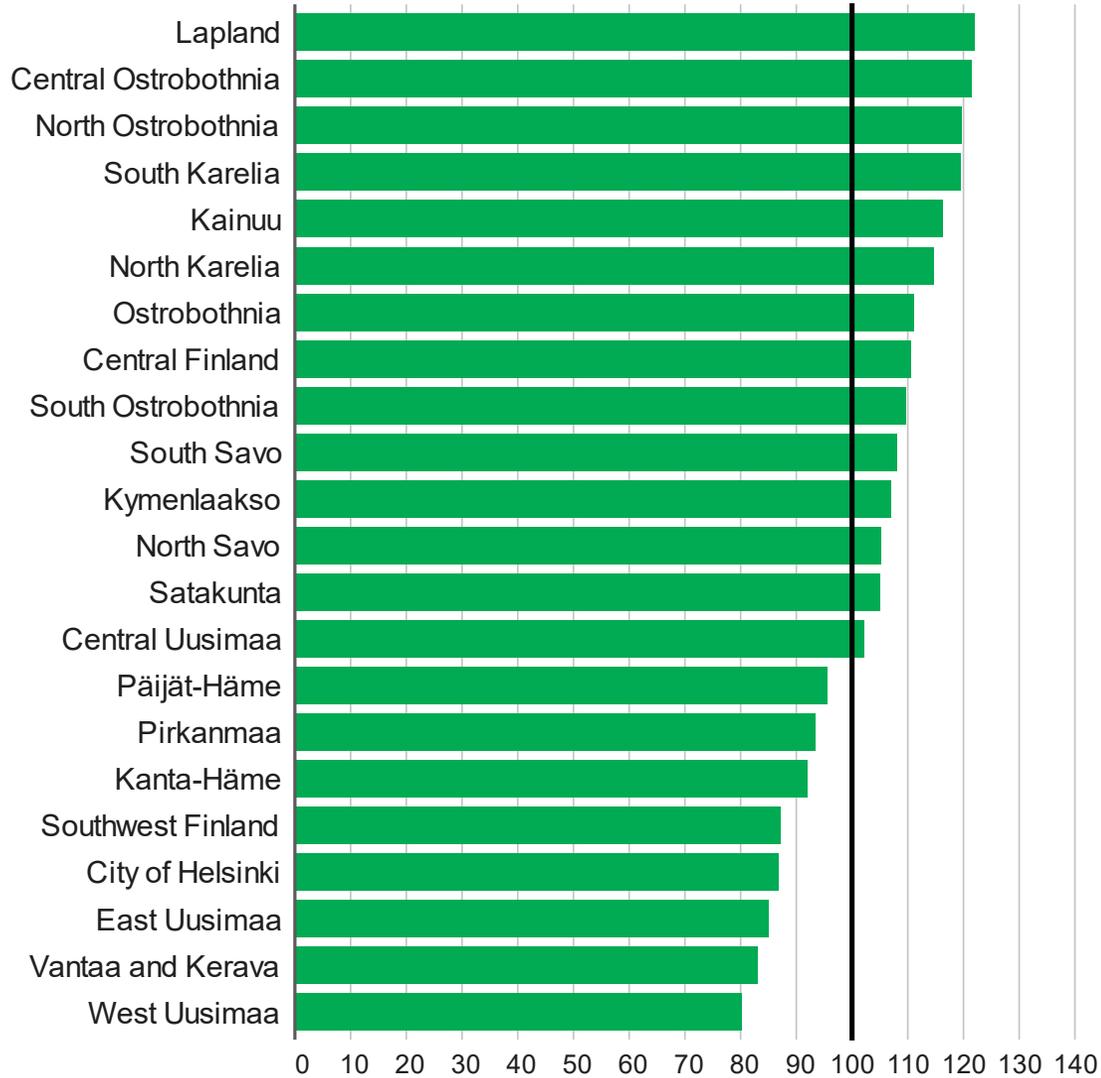

# Coronary disease

- The index describes hospital care or death outside hospitals due to the incidence of acute coronary syndrome events among the region's population aged 35 to 79 years relative to the national level.
- The index includes first-time or recurrent cases of acute myocardial infarctions and angina pectoris that led to hospitalisation, and fatal attacks outside of hospital.
- Incidence of coronary disease events is the highest in the wellbeing services counties of South Karelia, North Ostrobothnia and Lapland and the lowest in the counties of Vantaa and Kerava and Western Uusimaa.

Age-standardised

Cerebrovascular diseases index 2021–2023, women  
Age-standardised

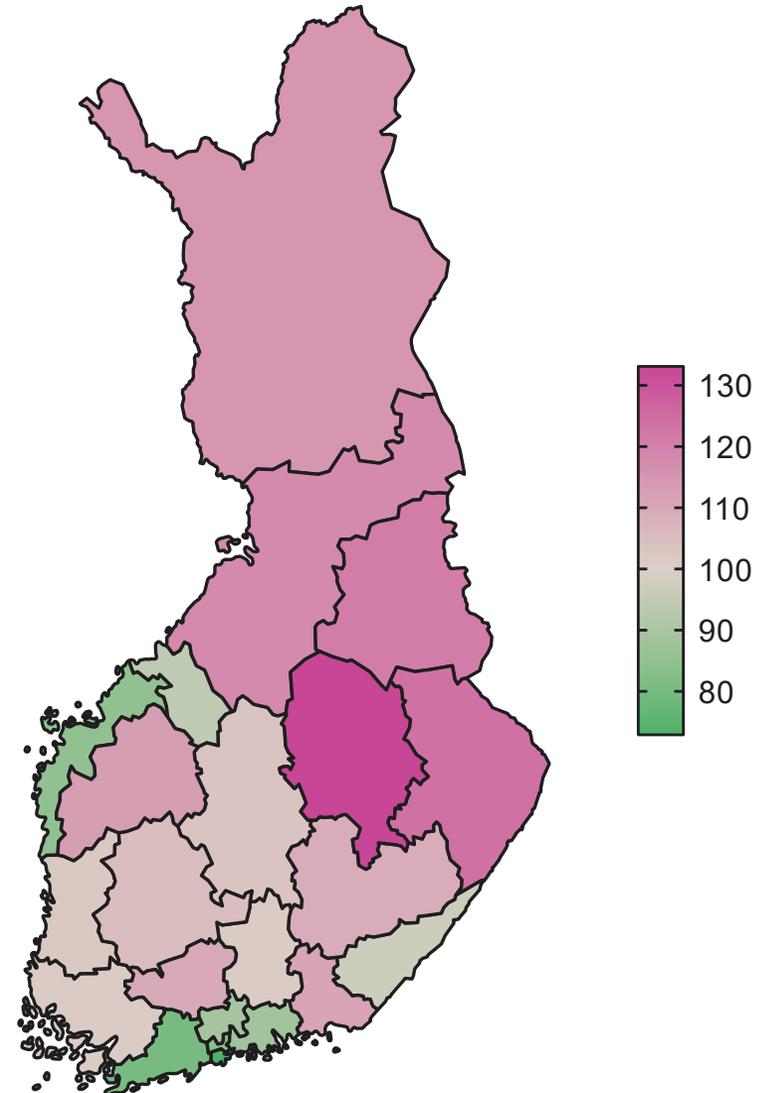

# Musculoskeletal disorders

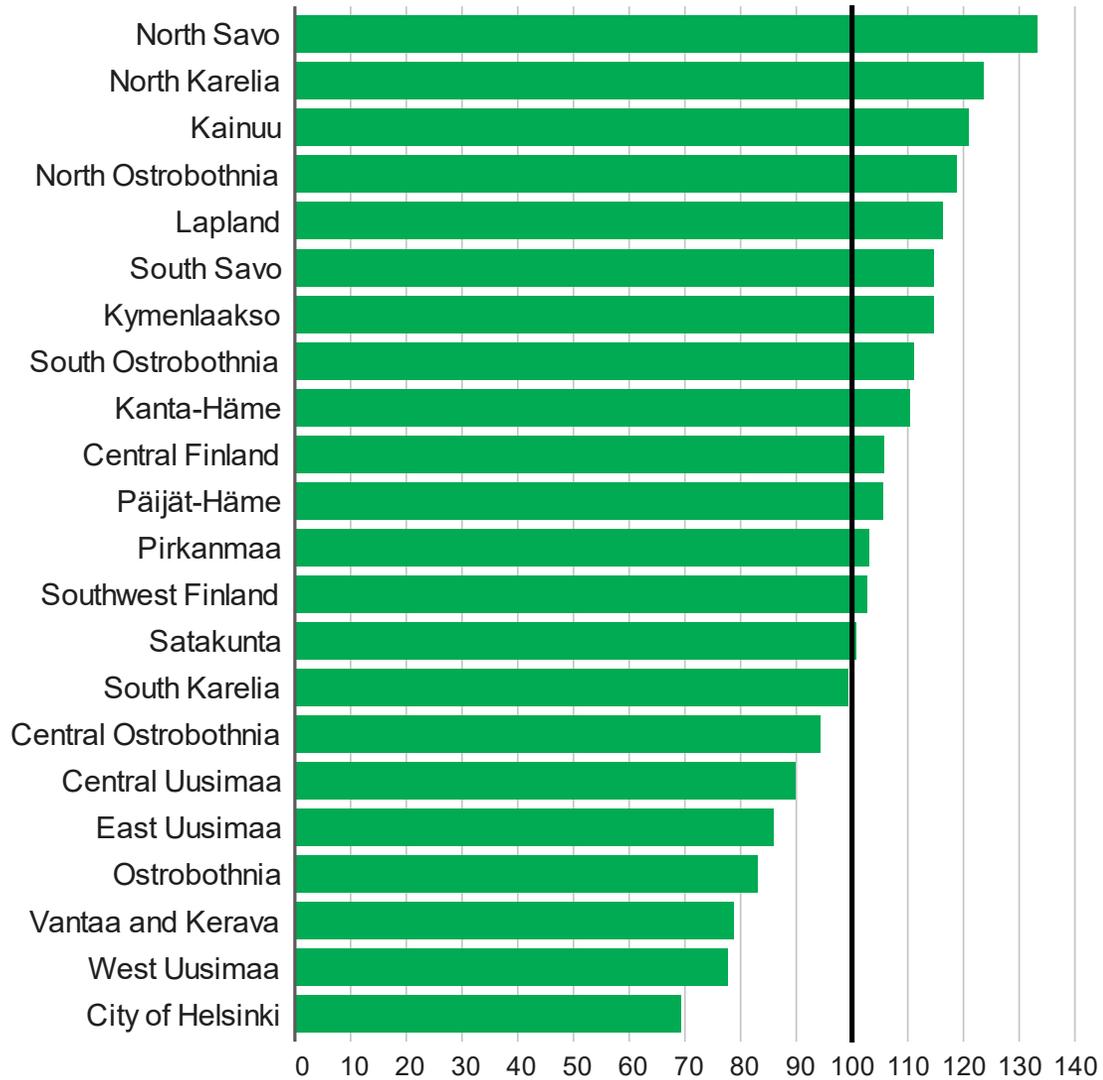

- The index describes the number of persons having musculoskeletal disorders (MSDs) among the region's population relative to the national level.
- The index definition includes persons who received disability pension due to MSDs or who were granted the right to special reimbursement for antirheumatic medicines.
- The indicator describes the prevalence of long-term MSDs and those with the heaviest disease burden. A significant proportion of less severe MSDs are not covered.
- Morbidity is the most common in the North Savo, North Karelia and Kainuu wellbeing services counties, and the least common in Helsinki.

Musculoskeletal disorders index 2021–2023, women  
Age-standardised

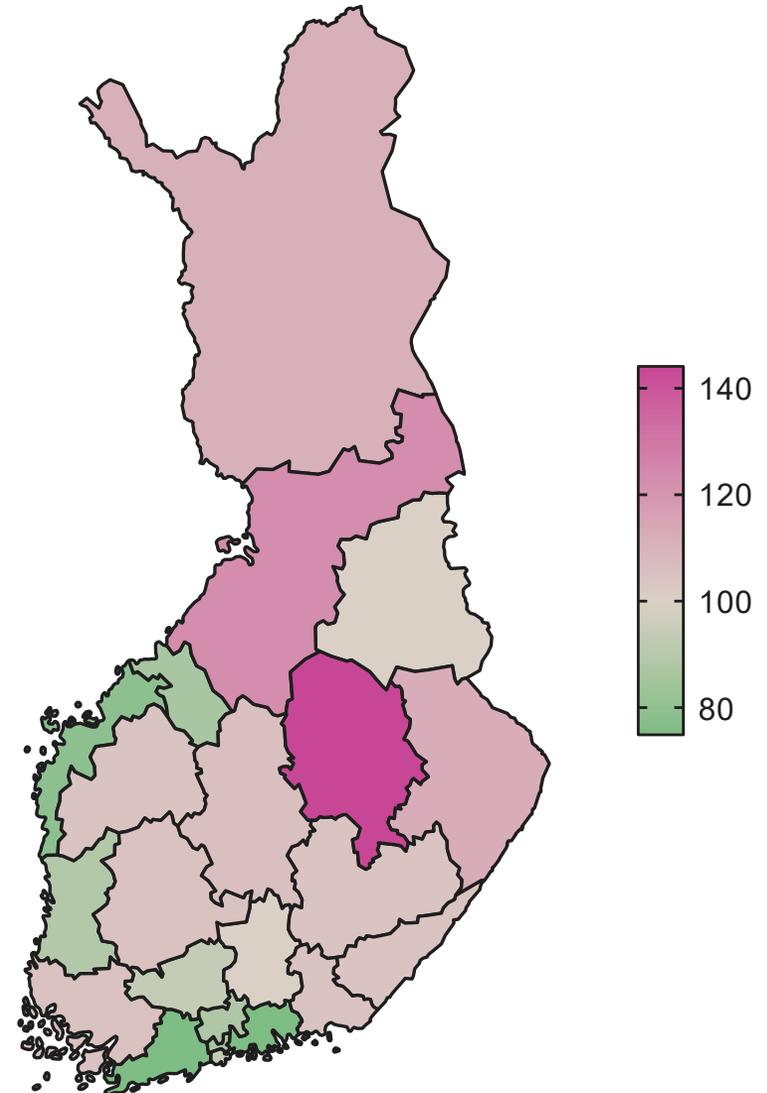

# Mental health

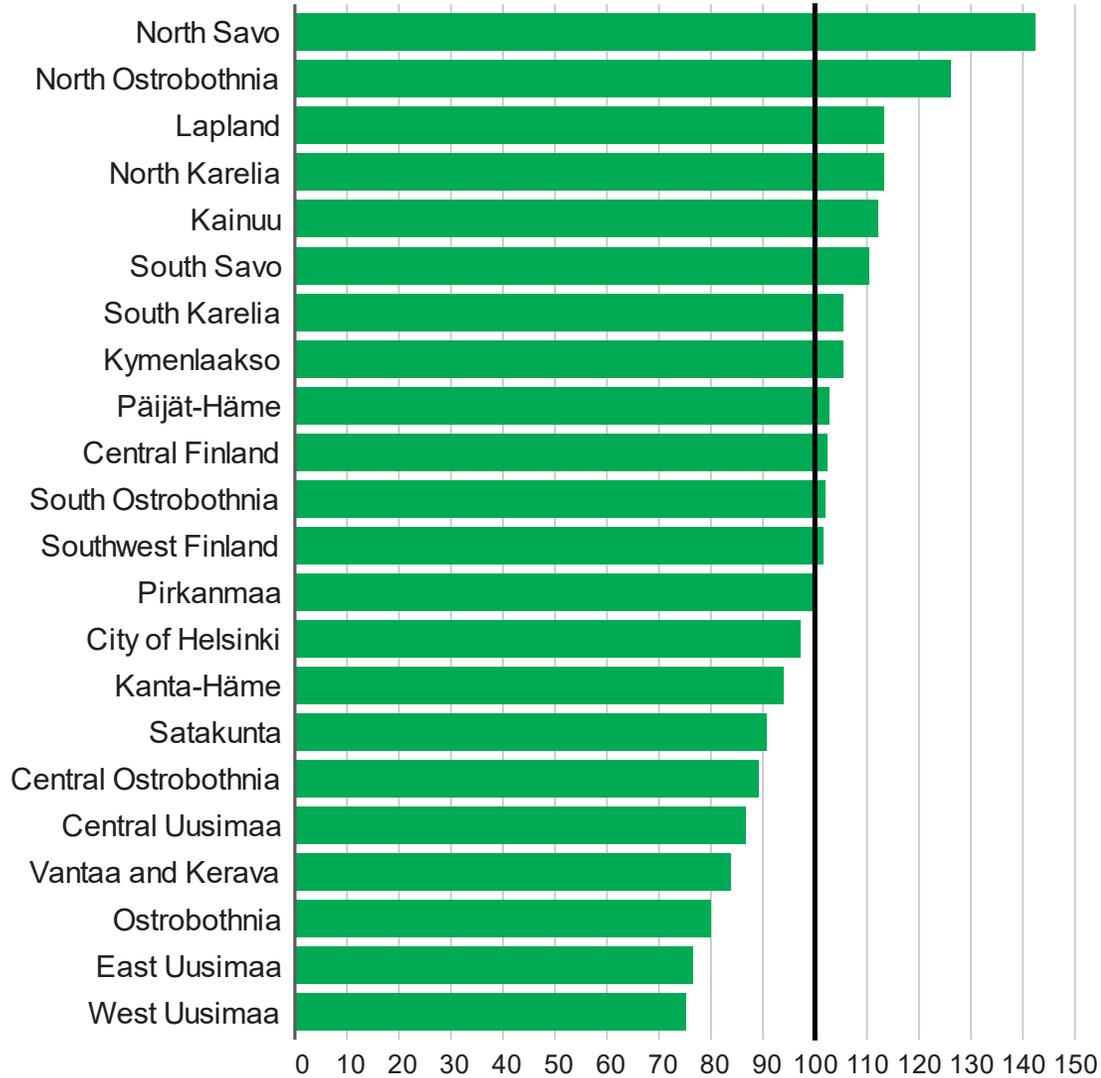

- The index describes the prevalence of severe mental disorders in the region's population relative to the national level. The index combines three indicators of morbidity:
  - Share of the region's population aged 16 to 64 years receiving disability pension due to mental health disorders.
  - Share of region's population aged 13 years or older treated in hospital due to self-harm or who died by suicide.
  - Share of the region's population entitled to special reimbursement for medicines to treat psychosis.
- Each of the three indicators have an equal weight in the mental health index.
- Morbidity is most common in the wellbeing services counties of North Savo and North Ostrobothnia, and the least common in Eastern and Western Uusimaa, and in Ostrobothnia.

Age-standardised

# Chronic respiratory diseases

- The index describes the prevalence asthma, chronic obstructive pulmonary disease and sleep apnoea in the region's population aged at least 20, relative to the national level.
- Index definition includes diagnosis codes by physicians in the specialised and primary healthcare, and eligibility for special reimbursement of medicines.
- Morbidity is the most common in the wellbeing services counties of Kainuu, Central Ostrobothnia and North Karelia, and the least common in Western Uusimaa and Helsinki.

Age-standardised

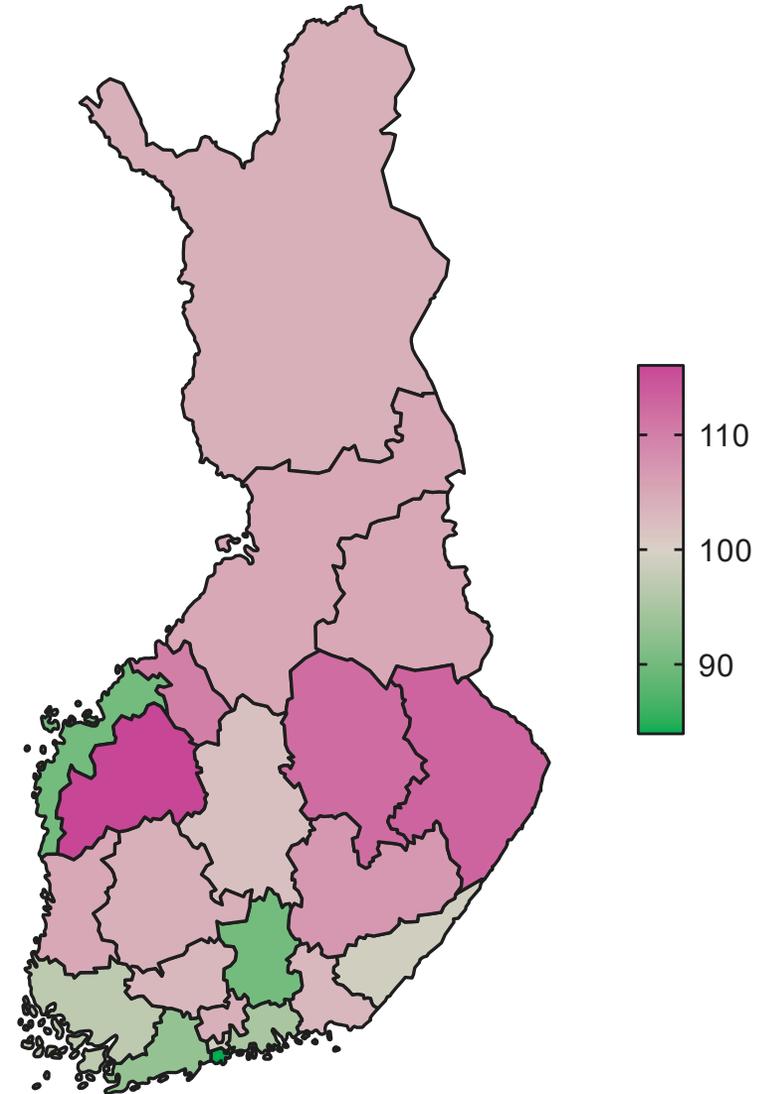

Respiratory diseases index 2021–2023, women  
Age-standardised

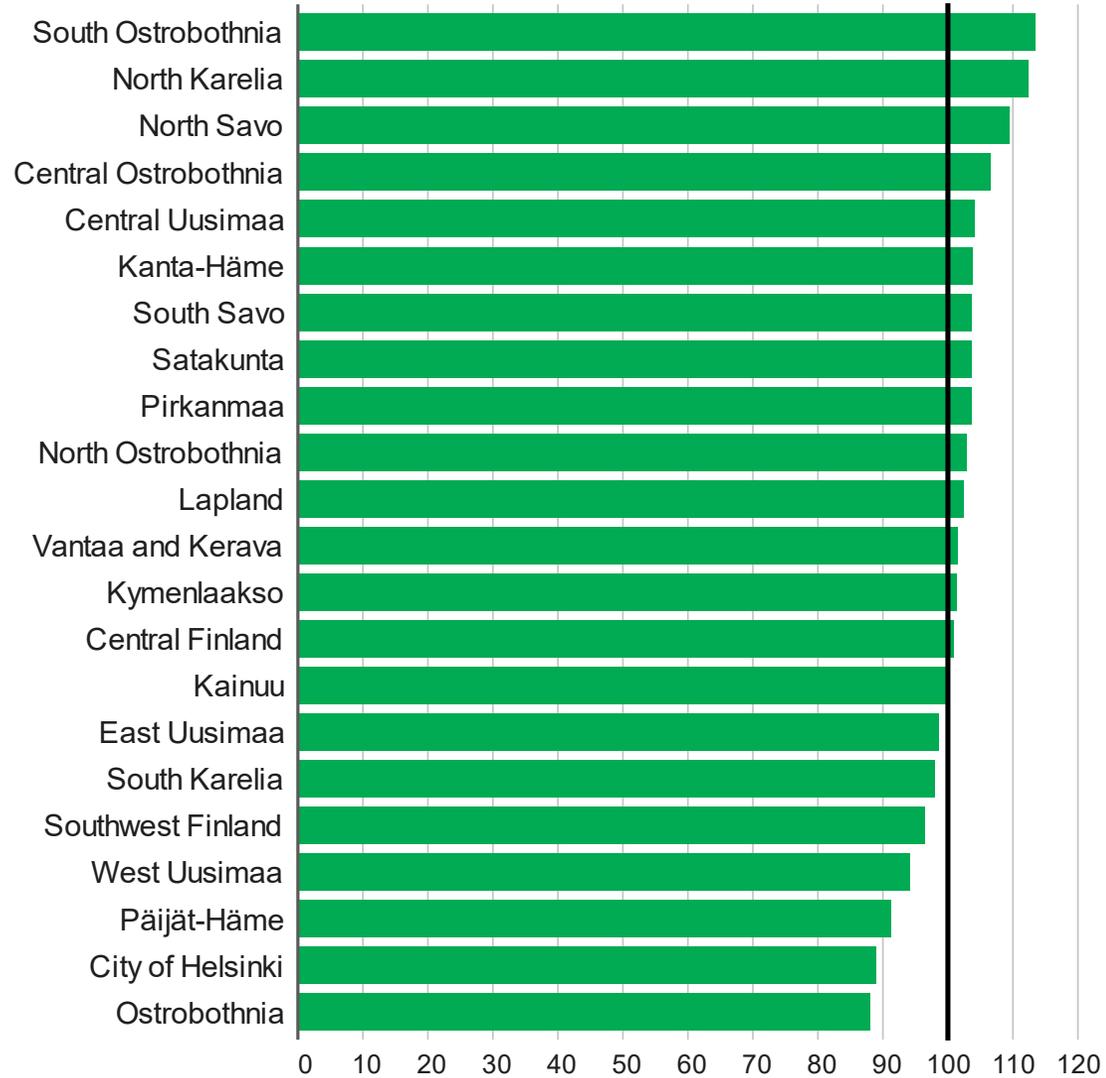

# Diabetes

- The index describes the prevalence of diabetes in the region's population relative to the national level.
- Index definition includes diagnosis codes in the specialised and primary healthcare, primary care physician visits, medicines purchases, and eligibility for special reimbursement of medicines.
- Diabetes is the most common in the wellbeing services counties of South Ostrobothnia, North Karelia and North Savo, and the least common in Helsinki, Päijät-Häme and Ostrobothnia.

Age-standardised

# Alcohol-related diseases

- The index describes the share of region's population having received treatment for an illness or other condition related to excessive use of alcohol, relative to the national level.
- The index definition includes diagnosis codes in the specialised and primary healthcare, primary care physician visits, social welfare services and prescription medicine purchases.
- Alcohol-related morbidity is the most common in the wellbeing services counties of South Karelia, Kainuu and North Karelia, and the least common in Ostrobothnia.

# Total index for work disability

- The index describes the prevalence of work disability among the region's population relative to the national level.
- The index combines information on three indicators of work disability benefits: work disability pensions, sickness allowances and favourable decisions on vocational rehabilitation applications.
- Each of the three indicators are calculated based on the population share of the work disability benefits recipients among the region's population aged 16 to 64 years.

# Work disability pensions

- The index describes the share of the region's population having received work disability pensions or partial work disability pensions, relative to the national level.
- The share of population on work disability pension is the highest in North Savo, North Ostrobothnia and Kainuu, and the lowest in Helsinki, Western Uusimaa and the Vantaa and Kerava wellbeing services counties.

# Sickness allowances

- The index describes the share of the region's population having received a sickness allowance period of more than three months based on work disability, relative to the national level.
- Being granted sickness allowance is the most common in Kainuu, Central Ostrobothnia and Lapland, and the least common in Helsinki, Western Uusimaa and the Vantaa and Kerava wellbeing services counties.

# Favourable decisions on vocational rehabilitation applications

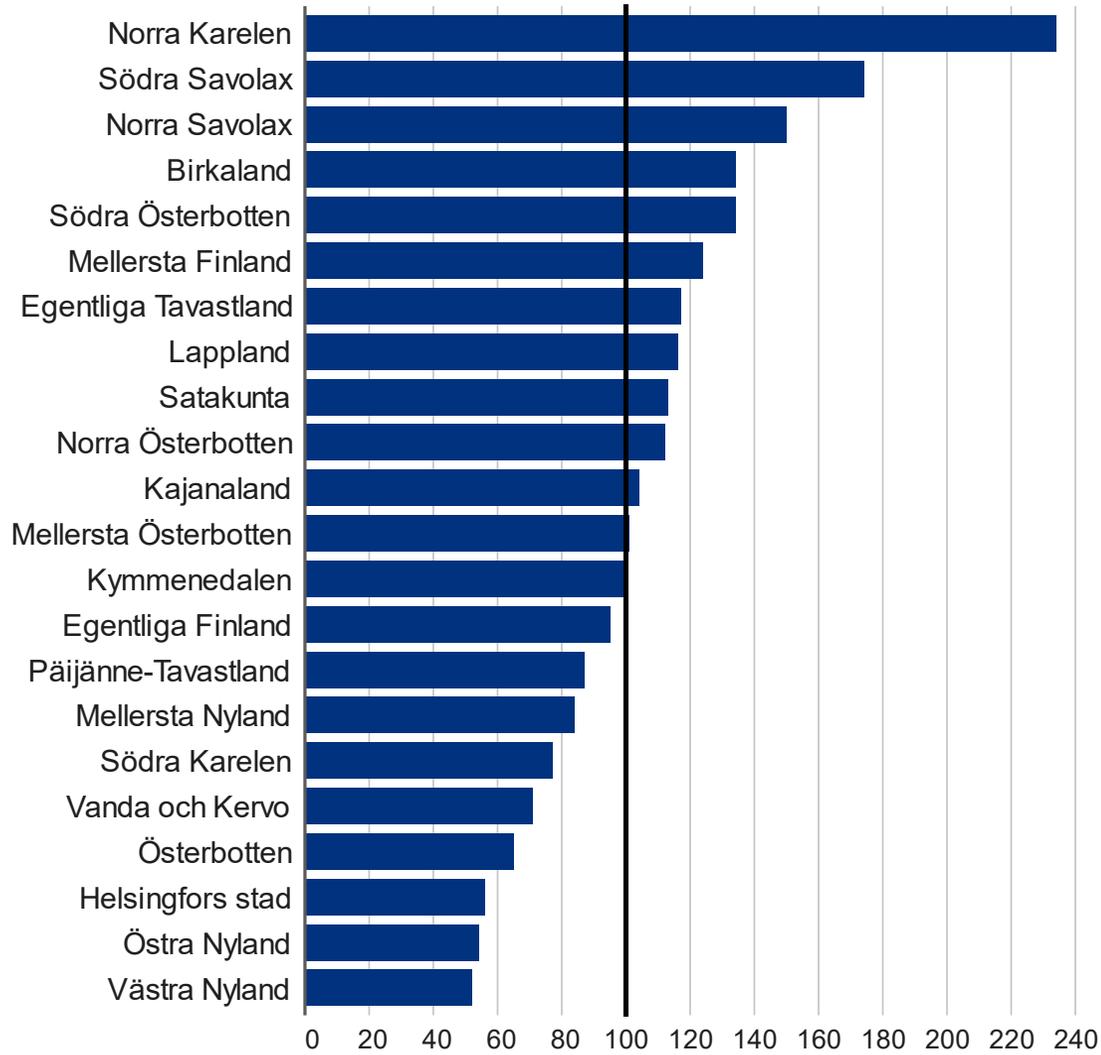

- The index describes the share of the region's population having received a favourable decision on vocational rehabilitation application, relative to the national level.
- The share of those granted a favourable decision on vocational rehabilitation application is the highest in North Karelia, North Savo and South Savo, and the lowest in Eastern and Western Uusimaa and Helsinki.
